L15 ANSWER 1 OF 20 CA COPYRIGHT 2001 ACS
AB A method for controlling starch synthesis in tomatoes by selecting desired
F1 offspring phenotypes of interspecific crosses of Lycopersicon spp. with
Lycopersicon esculentum genotypes is disclosed. Individuals that contain
an allele of a gene that increases starch synthesis, specifically
ADP-glucose pyrophosphorylase (ADPGPPase) gene, originating from the
Lycopersicon spp., is selected. Preferably, the gene codes for a
Lycopersicon hirsutum-derived subunit of ADPGPPase, and Lycopersicon
hirsutum large subunit (LS1) of ADPGPPase is used as mol. marker.
Selection involves measuring the ADPGPPase activity of a young fruit. A
method of producing a transgenic plant with elevated starch content is
also provided. The selected gene is introduced into a plant cell as
recombinant DNA, and the transgenic plant is regenerated from it and
propagated by either vegetative propagation or by seed.
